

Our own ad-making machine, explained simply.

Right now our best creative system lives inside someone else's tool (MaxFusion), it stops working the moment nobody has it open in a browser, and it burns through credits fast. We are going to build our own version. Same quality, always on, much cheaper, and it gets smarter with every client we win.

The problem, in three sentences

- 1. MaxFusion only works while a human is watching.** When our website tells it "make this video," the job just sits in a queue forever unless someone has the page open in a browser. We proved this three separate times this week. That makes true self-serve impossible.
- 2. It is expensive.** About \$500 of credits disappeared in one week, and the same AI video engine (Seedance 2.0) can be used directly for much less.
- 3. Our secret sauce lives in their house.** The prompts and winning formats our team perfected sit inside MaxFusion. If they change pricing, break something, or shut down, our system goes with it.

What we are building

Creative OS Studio: our own private version of the MaxFusion canvas, connected straight to the website clients already use. Three parts, all under our control:

- 1. The Engine (the important part).** A worker that runs on our own server, 24/7. It reads the product photo, writes the script the same way our designers taught it, and generates the video. Nobody has to keep a tab open. Nobody has to click Run. It just works, day and night.
- 2. The Dashboard.** One page where we see every client, every ad they generated, and the finished videos, ready to preview and download. Who made what, when, and how it turned out.

3. The Concept Library. Every winning format (15-second B-roll, street interview, unboxing, testimonial...) saved as a reusable template. When an ad works for one client, we press "save as template" and reuse that exact recipe for the next client. This is Ricardo's library idea turned into a product, and it is the part competitors cannot copy.

How it works for a client

1 They fill in 4 things on our website

Product name, website, audience, and a product photo. Then they pick a style and hit Generate.

2 The Engine picks the right recipe

It grabs the template for that concept, studies their product photo, and writes a script in that proven format.

3 The video generates automatically

Same AI engine as today (Seedance 2.0), but through the cheaper direct route. Takes a few minutes.

4 The ad appears on their screen

Preview in a phone frame, download button, done. And a copy lands in our dashboard under their name.

5 Winners become templates

When an ad performs, we save its recipe and every future client benefits from it.

Client fills the form

Concept template

Our Engine (24/7)

Video generated

Website + Dashboard

What stays exactly the same

- ✓ The website clients see. It is already live and already beautiful.
- ✓ The prompts our team perfected. We copy them over word for word (we already extracted all of them).
- ✓ The video quality. It is the same Seedance 2.0 engine underneath, just called directly.
- ✓ The look of the canvas. Our flows import into the new Studio unchanged, all 34 of them.

What gets better

Today (MaxFusion)	With Creative OS Studio
Video only generates while someone keeps a browser tab open	Runs on our server around the clock, fully automatic
~\$500 of credits burned in a week	Same engine through the direct route, a fraction of the cost per video
No view of which client made what	Dashboard: every client, every run, every finished video
Winning formats stuck inside their tool	Our own template library that grows with every win
One video at a time	Batch mode: 4+ different concept ads from one submission (like Ricardo's kitchen-set demo)

What we already proved this week

This is not a guess. Every piece of the Engine has already worked for real:

- ✓ Generated a complete 15-second UGC ad fully automatically, no browser, no clicks (the pillow ad Eric saw).
- ✓ The website already sends submissions and displays finished videos with a progress bar, exactly as Eric described.
- ✓ All 34 existing flows and every master prompt were pulled out safely, so nothing our team built gets lost.
- ✓ Found and fixed the bugs that were blocking the team's version (the "stuck in queue" mystery is solved: it is how MaxFusion is designed, not something we did wrong).

What we need to start

Item	Who	Effort
A fal.ai account (the cheaper doorway to the same video engine)	Eric or Carl	10 minutes + card
A free Supabase account (the database behind the dashboard)	Carl	10 minutes
Change the two API passwords we used during testing (safety habit)	Carl	5 minutes
The go signal	Eric	1 Slack message

Build order

1 Engine first

The website works end to end through our own engine. This is the moment MaxFusion becomes optional.

2 Dashboard

Clients, runs, and videos visible to the whole team.

3 Canvas

The visual flow view with live progress lights, our flows imported.

4 Template library

Save-a-winner, reuse-for-the-next-client. The compounding part.

Bottom line: we stop renting our creative engine and start owning it. Every client win makes the machine smarter, every video costs less, and the website finally does what Eric asked for: pick a style, hit generate, watch the loading bar, and a beautiful ad pops out. Automatically, every time.

Prepared July 4, 2026. A technical version of this plan exists for the build team: "Creative OS Studio - PRD.pdf" in the same folder.
